

Coding & Solution

Date	04 July 2026
Team ID	SWTID-2026-7391
Project Name	Credit Card Approval Prediction
Maximum Marks	5 Marks

Coding & Solution

This section evaluates the quality and completeness of your implemented code and the overall solution. Your submission should demonstrate working functionality, clean code practices, and alignment with your defined requirements.

Instructions:

1. Ensure your code is well-structured, commented, and follows best practices for your chosen technology stack.
2. The solution should address the core problem statement and implement the key functional requirements.
3. Include all source files, configuration files, and setup instructions needed to run the application.
4. Attach or link to your code repository (e.g., GitHub) in the table below.

Solution Summary

Field	Details
Repository Link / URL	https://github.com/megharammm/credit-card-approval-prediction
Programming	Python, HTML, CSS
Framework(s) Used	Flask, Scikit-learn
Key Features Implemented	Customer application form ,CCAP Using ML ,User-friendly web interface Data preprocessing ,Real-time prediction results
Pending / Incomplete Features	Email notification after prediction (if not implemented) Database integration (if not implemented)
Setup / Run Instructions	Install Python libraries using <code>pip install -r requirements.txt</code> . Run the Flask application using <code>python app.py</code> . Open the local URL in a browser. Enter customer details and click Predict to view the result.

Code Quality Checklist

S.No	Criteria	Status (Yes / No)
1	Code is modular and organized into functions / classes	Yes
2	Meaningful variable and function names are used	Yes
3	Code includes comments / documentation where necessary	Yes
4	Error handling is implemented for critical operations	Yes
5	The application runs without critical errors	Yes
6	Code is committed to a version control repository	Yes

Additional Notes / Comments:

The Credit Card Approval Prediction system is developed using Python, Flask, and Scikit-learn. The application analyzes customer details such as income, employment status, credit history, and other financial information to predict whether a credit card application will be approved or rejected. The code follows modular programming principles, making it easy to maintain, reuse, and extend in future versions.
